Team Charter / Declaration

Declaration that all text contained within the presentation and report provided are written wholly without AI assistance, and that all members of this group contributed equally to work submitted.

Signed:

Alexander Morbey

Michal Kosnik

Niall McConnell

Toby Irwin

Luka Christodoulou

Lingkun Meng

- Attend meetings and be on time
- Collaborate equally
- Inform group if unable to attend a meeting
- Weekly meetings
- Support each other's slides
- Take pride in your work

Team charter guardian – Toby Irwin

Report Layout (example)

Each section in this report is dedicated to one slide from the PowerPoint presentation.

The heading of each page represents the title and slide number of the referred slide (the name of the person who presented that slide during the presentation is in parentheses).

The content from each slide is included in these boxes so that you don't need to jump between this document and the PowerPoint.

Any relevant images used in a slide are displayed above this cell and labelled *exhibit 1, exhibit 2* etc.

For slides which included only an image and no text, there is not a box like this one.

Explanations and scripts used for each slide are included underneath the boxes.

Sections for which additional explanation was requested during the feedback of the presentation will include an additional subheaded page with the requested information, or will include a more detailed explanation than in the presentation.

These sections are highlighted in the contents section.

Slide 2 - Who is FutureLogic? (Niall)

Consultancy specialised in creating digital transformation change

Broad cross-sector experience in delivering AI-enabled change including:

- *Analysing strategic drivers*
- *Opportunity identification*
- *AI enabled solutions*
- *People first augmentation*
- *Value creation*

We are FutureLogic Consulting. We focus on building strategy-based digital transformation.

Our cross-sector experience brings a wider lens for identifying opportunities from optimisation to innovation. We start with your strategic drivers, making sure our solution is relevant to your growth, efficiency and competition in the industry.

We identify opportunities for artificial intelligence to augment human workflow in the organisation's existing processes, designing solutions that enhance decision-making and learning seamlessly.

We see ourselves as a catalyst for delivering scalable solutions capable of creating measurable value and change in our clients, whether that's seamless enterprise homogeneity, optimised workflows or improved client outcomes.

Slide 3 - Who is InnoWave Global? (Niall)

- *Headquartered in London*
- *25,000 employees globally*

Primary markets:

- *Europe*
- *Asia*
- *North America.*

Services:

- *Multi-sector consultancy*
- *Digital transformation*
- *Technologically enabled solutions*

Focusing on your company, InnoWave Global is headquartered in London, with 25,000 employees globally. InnoWave's primary markets are in Europe, Asia and North America. This global organisational footprint sets up for knowledge and expertise to be distributed widely but also lost in translation.

Key services are multi-sector consultancy, digital transformation and technological solutions. This means diverse and technical information sharing which demands access to policies and expert insights through centralised intelligence.

Your familiarity with digital transformation and tech-enabled solutions positions you to adopt next-generation AI solutions that modernise internal workflows and enhance the value your employees in key roles deliver through augmenting their work processes - such as highly technical innovation strategists like John.

Slide 4 - Meet John, the Innovation Strategist (Employee persona) (Toby)

John, Innovation Strategist, 6 years at InnoWave:

"I spend more time hunting for information and files compared to creating them."

Daily Challenges:

- *Duplicated work - Repeats work done in other regions.*
- *Fragmented knowledge - 15 hours a week spent on searching for existing knowledge and files.*
- *Limited collaboration - No transparency into global innovation projects.*
- *Limited innovation time - Admin issues wasting creative innovation time.*

Meet John- he is an innovation strategist at InnoWave who has been working at the London HQ for just over 6 years now. His job is to spot opportunities and turn them into strategies for his clients. He develops concepts through the analysis of trends via primary and secondary research. John's work needs intense attention to detail and creative thinking which is something that can't be automated. But he faces serious issues which are limiting his ability as an innovation strategist.

Firstly, he duplicates work constantly, spending days looking into a market trend just to find out that Diego in the Barcelona office has already conducted a full analysis into the trend weeks ago.

Secondly, knowledge is fragmented, John wastes 15 hours every week just searching for documents which should be easily accessible to anyone within the global company. Additionally, when he's searching for documents, he often finds files which should not be accessible to him which concerns him from a cyber-security standpoint.

Thirdly, collaboration is significantly limited within InnoWave, the company operates all over the world, yet John has no visibility on what people are planning on doing outside the London HQ.

Finally, the admin issues affects his output as an innovation strategist as time he should be spending on experimenting with ideas, he must spend it on hunting for information within his own organisation. These issues aren't singular to just John, these are system issues within InnoWave that our AI solution would solve and would allow InnoWave workers just like John to perform at a higher efficiency level.

Slide 5 - Daily Issues faced by Innovation Strategists (Michal)

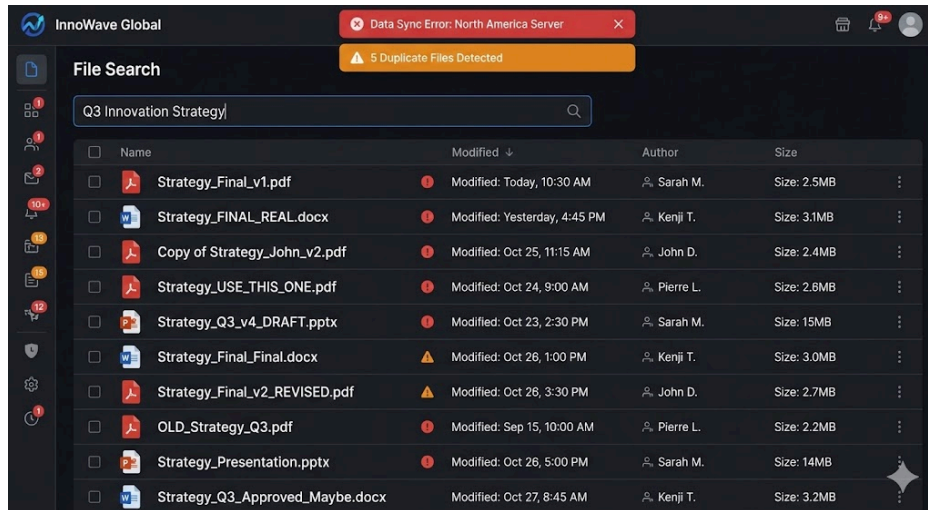

Exhibit 1

Increased fragmentation and friction between departments.

Regional offices often operate with their own processes and digital tools.

Teams struggle to collaborate.

Language barriers.

Service and methods are inconsistent between departments.

Here's a screenshot of the daily nightmare John and his coworkers face: data sync errors, duplicate files, missing files.

All of these daily issues we just spoke about- fragmentation, friction, inconsistency, wastefulness, confusion- these all result in the Innovation Strategist not being able to do his job or collaborate with coworkers smoothly, and with limited opportunities to experiment with new ways of working. Ultimately hurting the overall innovation and strategisation of your company and your clients.

Slide 6 - Solution Proposal - Introducing *WaveAssist* (Michal)

The platform: A single, secure digital workplace replacing InnoWave's fragmented regional tools.

The engine: An integrated 'always-on' AI assistant embedded directly into every workflow: InnoBot.

The brain: Unlike public AI's, InnoBot is securely trained on InnoWave's internal database to leverage the 25k employee knowledge base.

The function: Seamlessly combining file sharing, live communication, and knowledge retrieval in one window.

Our proposed Solution to these problems is called WaveAssist:

A general assistive platform that is deeply integrated with InnoWaves work, projects and resources, and specifically designed to solve the needs of your innovation strategists.

Everything they will need is on a single, secure digital workplace, powered by the AI engine we call InnoBot.

InnoBot acts not only as an assistant who you can collaborate with individually or in group chats with your employees, acting as a catalyst for your creativity;

It also acts as an archivist who is securely trained on InnoWave's internal database, leveraging the knowledge of every single one of your 25,000 employees.

Additionally, it serves as a librarian who helps you share and retrieve files easily, without the familiar mess of *Exhibit 1*- as shown in the next slide and *Exhibit 2*.

Slide 7 - The Result (Michal)

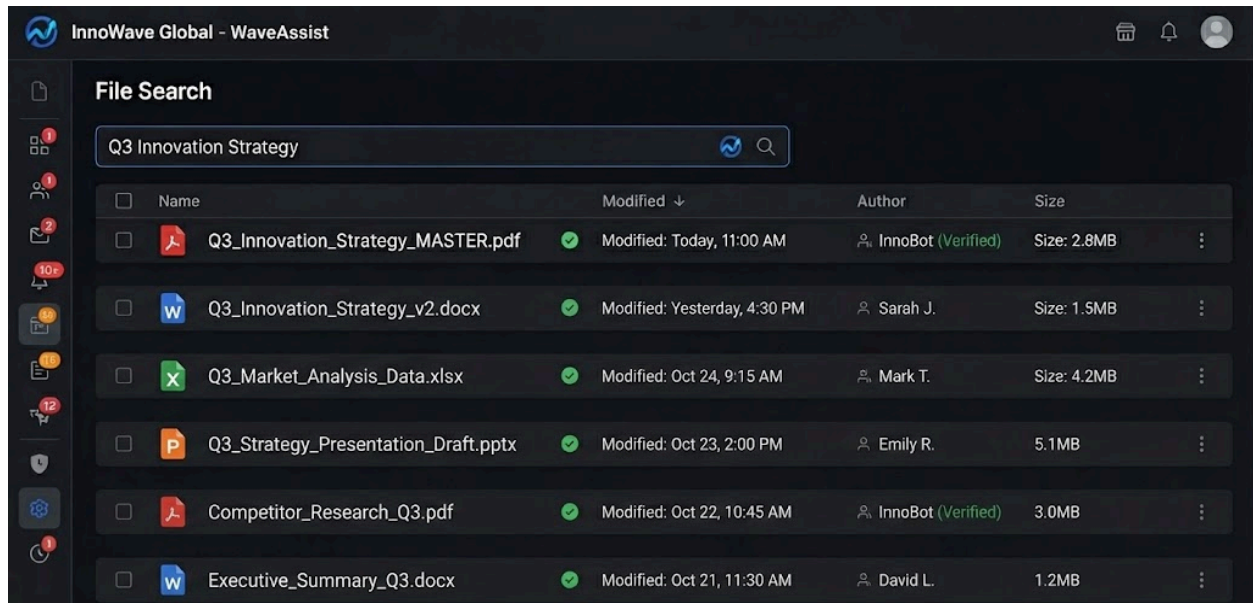

Exhibit 2

imagine a global shared library where:

- you can throw in as many books or documents as you want
- all duplicates are sorted and grouped instead of being scattered all over the place
- everything is translated to your language you can instantly find any document you need just from a description of its content*
- and you can see the owner and author of everything
- all with a simple, familiar user interface.

It all just makes sense.

No more time wasted on admin nightmares, and more time on what we like to call '*collaborative creative sparring*'** with innobot and coworkers.

We will show some more examples of WaveAssist's and InnoBot's features in action, but first let's briefly show you how easy our technical onboarding and implementation process will be for you and your employees.

The Result - Further explanation

**The difference between our solution and a standard rule-based data organisation library, is that it can index for not only explicit searches such as title of a document, any metadata such as dates or authors/owners, or words contained in a document; you can also search for a document based on a description of what you're looking for, which is something a standard rule-based software couldn't do.*

Rather than only looking for specific words within a document, it can also search for semantic meanings or summaries of it. For example, if you forgot the title, author, modification date etc of a specific document, but you know roughly what the document was about, then this is all the WaveAssist AI needs to search for your document.

***By 'collaborative creative sparring', we simply mean using InnoBot as a catalyst for your and your teams' creativity- You can use InnoBot to bounce ideas off of, and InnoBot will critique your ideas and give you feedback, with evidence from InnoWave's database.*

This sounds similar to other public LLM's, however InnoBot features the ability to work in group chats with multiple employees which is something no other LLM's offer. This amplifies the synergy of your team exponentially, and is a lot more powerful in innovating and creating original, new ideas, than with only a person-AI duo.

(Interestingly, ChatGPT 5.1 is slowly implementing some sort of group feature which doesn't seem fully fleshed out yet- this must be a sign that our idea is good!)

Slide 8 - The Architecture (Michal)

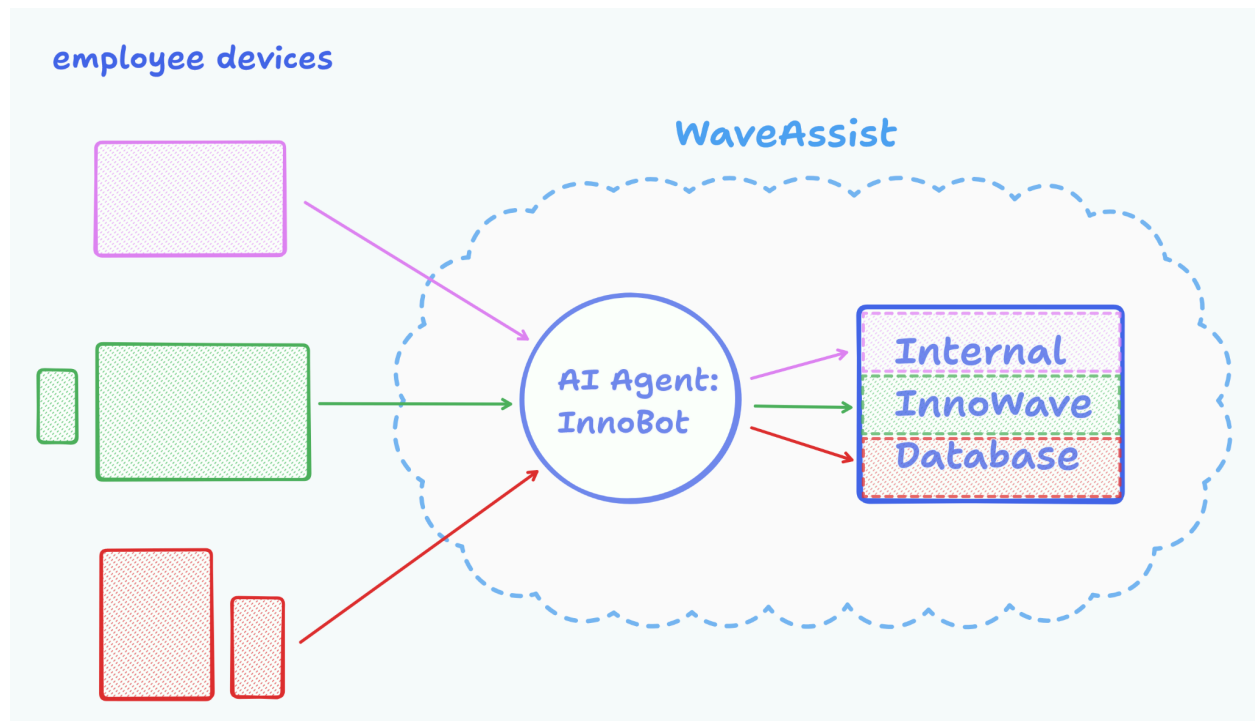

Exhibit 3

Here is a simplified diagram of the architecture of how waveassist connects to your company, mediates between you and your employees, connects everyone together, as well as how files are managed.

we won't bore you with too much technical detail (more details will be found in the report), but the key takeaways are that:

- The software onboarding / implementation process for your employees is as simple as installing the app on their work devices (point to diagram, works on phone pc and tablets),
- WaveAssist intelligently works out employees' permissions and access to the appropriate parts of your database (point to diagram), based on roles, regions, individual projects, etc. These control parameters are ultimately in your managers hands, to make sure files don't get into the wrong hands.

The Architecture - Further explanation

The simplicity of this system allows an extremely easy software onboarding process- all that is needed is for WaveAssist to be installed and gain admin access to your main internal servers, and for your employees to download the WaveAssist software and applications on their work laptop, phone, tablet etc (available on most operating systems).

As shown in Exhibit 3, InnoBot acts as an intermediary between your company database and your employees devices. WaveAssist gains access to your database, and InnoBot is securely and internally trained on this data. Your employees then access the company data through the WaveAssist user interface, or through asking InnoBot to find it for them.

What is not clear from this diagram is the collaborative aspect between employees, and involving InnoBot, therefore the arrows connecting the employees devices with InnoBot should be double-sided.

Slide 9 - Strategic alignment - Scale into speed (Luka)

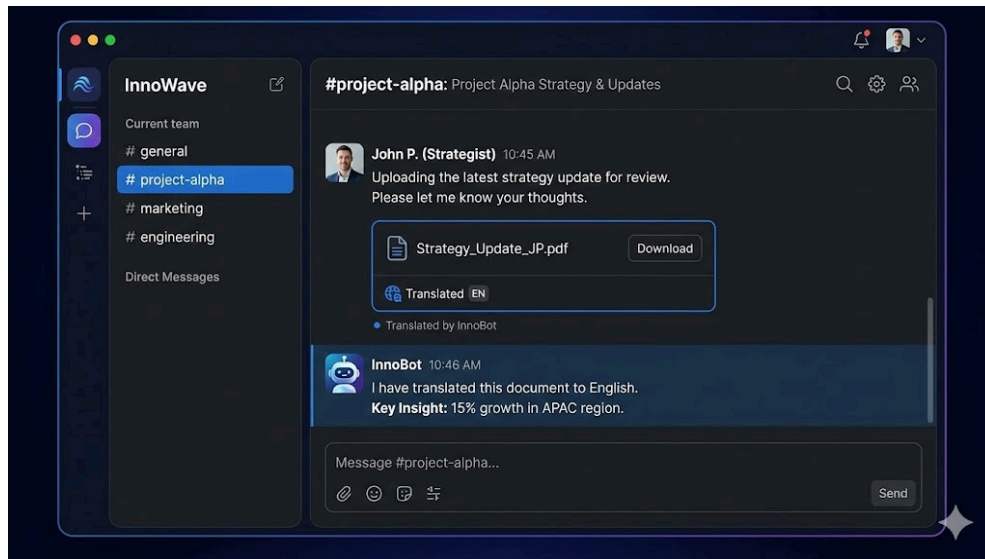

Exhibit 4

Augmentation: Removes administrative lags such as manual file searching, to maximise high-value creative time, and auto translates documents.

Leveraging 25k advantage: Unlocks the global knowledge base, combining startup speed with incumbent resources

So, how does WaveAssist with your broader strategic goals? It solves the fundamental paradox large organizations often face, which is having the resources of a large company, but with the agility of a startup.

As we see in Exhibit 4, WaveAssist aligns with your strategy in two ways.

First, through augmentation. By removing the administrative lags, we aren't just saving time, we are improving the focus and efficiency of each one of your employees. We are moving the time spent by your workforce from low-value admin maintenance, to high-value creative output.

Second, it allows you to leverage your 25,000-person advantage. Usually, size slows you down. But with InnoBot having your global knowledge base in its brain, your size becomes your strength. You get the speed of a small, agile team because the information flow is instant, while retaining the massive resource backing of a global enterprise. We turn your scale into speed.

Slide 10 - Augmenting the workflow (Lingkun)

Intelligent retrieval: Replaces manual file hunting with natural language queries, for instant location and summarisation.

Global collaboration: Live-translates documents and chats, removing language barriers enabling instant regional feedback.

Creative sparring: Provides private sandbox for innovation strategists to brainstorm & stress-test concepts against internal company data.

Automated admin: Automatically records and summarises meetings, shifting focus from administration to core value creation.

In line with InnoWave's strategic vision of "enhancing employee capabilities with artificial intelligence," this project's AI workflow aims to systematically improve organizational cognitive efficiency and collaboration quality.

Intelligent information retrieval utilizes natural language semantic analysis to quickly locate and summarize internal knowledge assets, reducing information search costs and improving organizational knowledge accessibility.

Global collaboration leverages real-time translation and cross-language text alignment technologies to effectively mitigate communication friction between regions, enabling distributed teams to make synchronized decisions with greater timeliness.

Simultaneously, a creative development space for innovation activities provides strategists with a controlled and data-driven proof-of-concept environment to support the evaluation and iteration of early ideas.

Automated administrative processes reduce administrative labor through automatic recording and summary generation of meeting content, allowing employees to refocus on high-value analytical and innovative tasks.

This AI workflow builds a higher-level knowledge collaboration mechanism and innovation capability foundation for the organization, propelling it towards a sustainable digital competitive advantage.

Slide 11 - Benefit Tree (Lingkun)

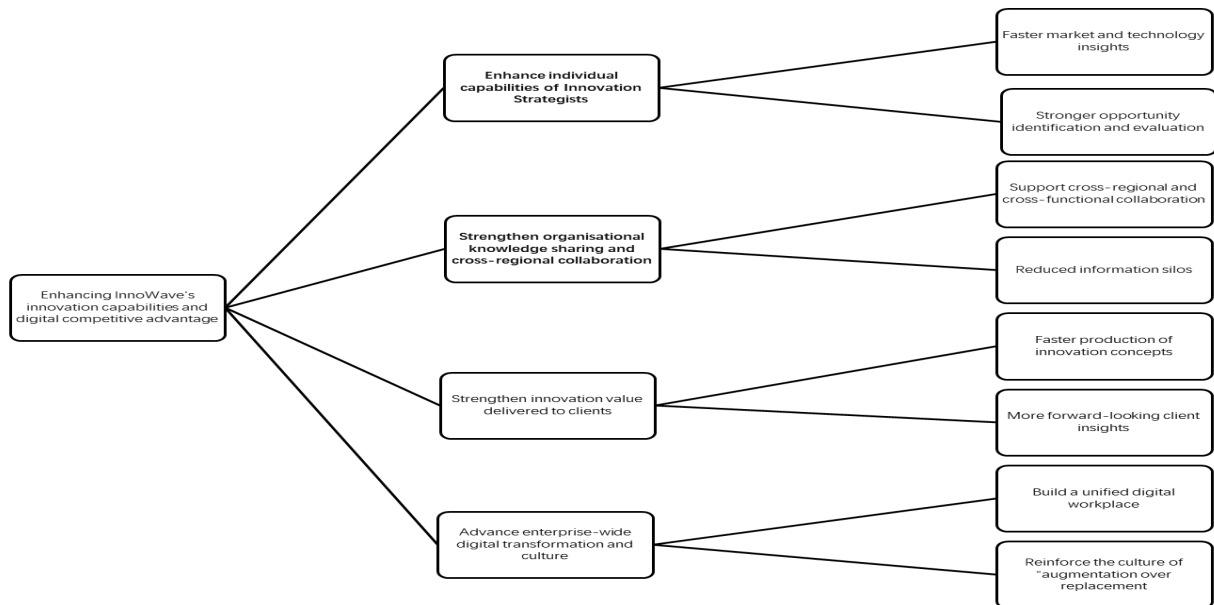

Exhibit 5

The future development of AI will further expand the value available to InnoWave. As more advanced generative AI, automated agents, and predictive models mature, AI will not only support current innovation processes but also drive companies towards a more proactive and forward-looking approach to innovation. Future AI systems will be able to identify market trends and technological shifts earlier, enabling innovation teams to prepare before opportunities emerge and enhancing the company's competitiveness in a rapidly changing environment.

AI's potential in knowledge management will also continue to grow. As multimodal knowledge integration and automated summarization become more sophisticated, knowledge within organizations will become more accessible and reusable, reducing information silos and improving cross-team collaboration efficiency. This means employees can learn faster, projects can progress more quickly, and the overall pace of organizational innovation will accelerate further.

As employees become more familiar with AI tools, the company will foster an open and encouraging work environment. Employees will be able to quickly test ideas through low-cost experimentation, creating a culture of continuous innovation. The future capabilities of AI will not only enhance internal efficiency but also increase the value the company delivers to its clients, enabling InnoWave to maintain a long-term competitive advantage in the digital consulting field.

Slide 12 - How John can use the Features (Luka)

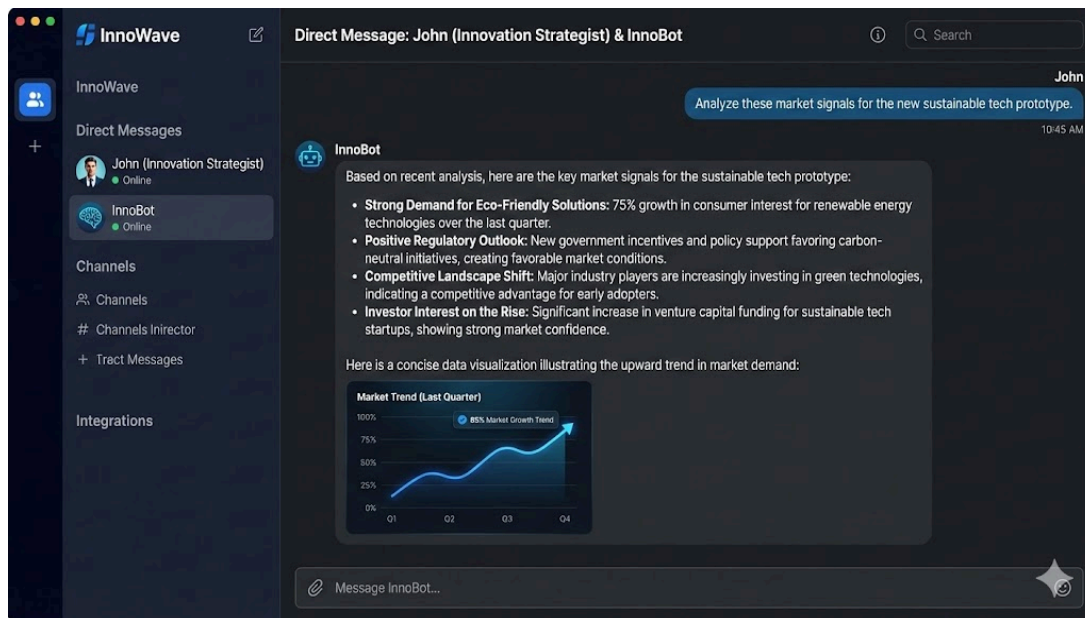

Exhibit 6

The file-sharing feature strengthens InnoWave's digital transformation by connecting teams, reducing duplication, and making expertise accessible across regions.

The AI collaboration feature accelerates idea exploration and concept development for Innovation Strategists while keeping human creativity central.

Let's talk about some examples of InnoBot's analytical thinking skills, which it does based on your global database and using context and critical thinking to realise what's relevant. Remember the duplicate work issue? John searches for a trend analysis on sustainable tech, and instead of waiting days for an email back, WaveAssist instantly pulls up the work Diego did in Barcelona. It translates Diego's Spanish notes into English for John automatically, and gives John some key market signals as starting points for his own analysis.

This is an example of John collaborating with InnoBot- or the 'Sparring' Michal mentioned. John doesn't just ask InnoBot to write a whole report for him- he can feed it his initial hypotheses, so that InnoBot can stress-test it against InnoWave's historical project data, and point out where and why similar strategies failed in 2021 or succeeded in 2023. The AI isn't doing the job *for* John; it is ensuring John is working with the collective wisdom of the entire company at his fingertips.

Slide 13 - Not just for Innovation Strategists (Luka)

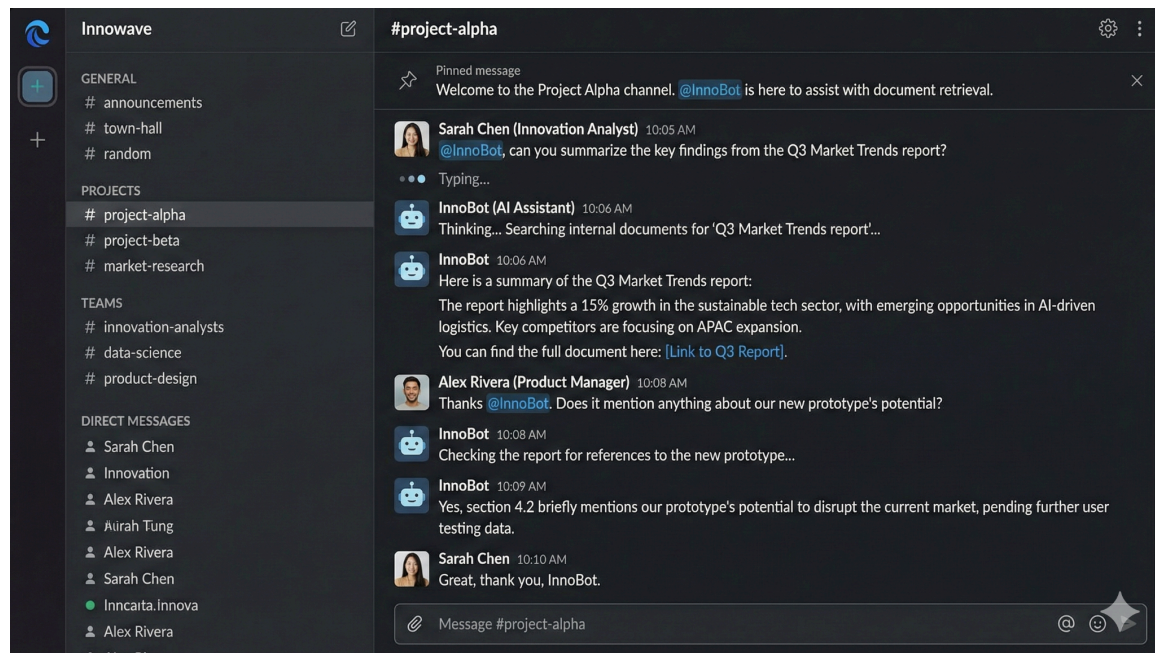

Exhibit 7

While the Innovation Strategist acts as the catalyst, InnoBot serves as the connective tissue for the entire enterprise. It unifies the workforce by allowing cross-functional teams—from engineering to HR—to collaborate on the same secure data in real-time.

We have focused heavily on John, however WaveAssist is not just a niche tool for Innovation Strategists. As shown in Exhibit 7, InnoBot Acts as the connective tissue for your entire enterprise. John can collaborate with HR or Engineering departments freely, or as seen in this example, with Product Managers from his team, or even other teams. All with the support of InnoBot to help save them all time looking for relevant documents, and even answering specific questions about the content of the documents.

HR teams can use WaveAssist to instantly find global policy documents to ensure compliance, without digging through static, rule-based intranets. I.T can troubleshoot technical issues across the world instantly by hopping on a quick call through WaveAssist, and InnoBot can help live-translate the call, and help diagnose issues. WaveAssist unified your workforce, allowing cross-functional teams to collaborate on the same secure data in real time; transforming InnoWave from a collection of fragmented regional offices into a synchronised global entity.
