

Market Research Project: Feasibility of Introducing BODR E-Scooters in Pamplona

Universidad
de Navarra

Michal Kosnik, Maximilian Nott, Moritz Arndt, Aleksandar Nemski, Miguel Angel Vich

Introduction

Objectives:

- Feasibility of introducing BODR e-scooters to university students in Pamplona
- Evaluate commuting habits and preferences
- Identify barriers and motivators for adoption of e-scooters
- Recommend strategies for BODR's market entry

Research questions:

- What factors would influence students adopting e-scooters in Pamplona?
- Are e-scooters a viable solution for students' commuting needs?
- Is the current pricing and infrastructure suitable to support adoption? Are changes needed?

Research Methodology

Mixed-methods Approach

Quantitative (survey):

- Captures statistical trends
- Empirical data that can be graphed

Qualitative (focus group):

- Deeper insights into behaviours and preferences

Data Collection

Survey:

- 55 respondents
- Commuting habits, affordability, infrastructure

Focus groups:

- 8 sessions, 4-5 participants each
- Discussion of motivators, barriers and perceptions

Sampling

- Random sampling for surveys and focus groups
- Snowball sampling as backup

Target population:

- University students
- Ages 18-30
- Living in Pamplona

Key Findings:

Financial Insights

■ €100-200: ■ €200-300: ■ €300-400 ■ €500+:

Financial situation ratings:

- Average self-rating of financial situation: 3.16/5
- Indicates moderate financial capability among students

Price sensitivity:

- Preferred maximum spend for e-scooters: €100-200 (50% of respondents)
- Only 9% are open to spending over €300

Affordability as a barrier:

- 67% say cost is the primary reason for not using e-scooters

Transportation Habits

Commuting methods:

Walking: 70%

Bus: 16%

Other: 14%

Commuting times:

- 62% < 20 minutes
- 38% > 20 minutes

Students with commutes of over 20 minutes represent a potential market for e-scooters

Commute methods

E-scooter Perceptions

Interest:

- 31% of students are open to considering e-scooters

Barriers:

- Affordability : 42%
- Safety : 20%
- Infrastructure : 4%

Motivators:

- Convenience
- Saving time

Focus Group Findings

Safety Issues:

- Minimal concern; few mentions of balance, especially around corners

Infrastructure:

- Positive: dedicated, wide bike lanes
- Negative: lack of docking stations and charging points

Motivators:

- Convenience for longer commutes
- Flexibility

Sustainability:

- Seen as a bonus, not a primary motivator

Market Overview

Demographics

- University town
- 34% of population aged 15-39
- Young demographic ideal for e-scooter adoption

Market Trends

- Market projected to grow from \$23.7B in 2023 to \$39.8B by 2032
- Increasing demand for sustainable urban mobility solutions

Competitive Landscape

- NBICI (bike sharing), Lime, Reby, MOVO (e-scooter sharing)
- Infrastructure challenges: regulations regarding speed, parking, sidewalk use

Limitations of the Study

Sampling bias:

- Majority of participants lived closed to University, potentially under-representing longer commutes
- Findings may not apply to other regions

Research duration:

- Short timeframe limited depth of data collection and analysis

Infrastructure and sustainability

- Limited exploration of detailed sustainability impacts and infrastructure needs

Data quality issues:

- Some unserious survey responses (e.g. "teleportation" as a commute method)
- Data cleaning removes unreliable answers which may impact findings

Recommendations

Pricing Strategy

- Introduction of more affordable options (within €150–€200 range)
- Offer flexible rental options, e.g. €2/hour or €25/month

Marketing Focus

- Highlight convenience and time savings for long-distance commutes
- Position sustainability as a complementary benefit, rather than focusing on this

Infrastructure

- Collaboration with local authorities
- Addition of local docking stations and charging points
- Focus on areas with high student density and longer commutes

Safety and Education

- Offer workshops and safety resources to address balance concerns

Conclusion

Key findings

Students with longer commutes and moderate financial situations represent the core target market.

Affordability and safety are the primary barriers.

Convenience and time savings are the strongest motivators.

E-scooter viability

Clear potential for adoption among a subset of students if barriers are addressed.

Next steps

Future market research into more specific issues.

Implement a pilot program in Pamplona.

Use findings to refine pricing, marketing and infrastructure strategies.

Future Research Directions

Broaden Geographic Scope

Longitudinal Studies

Sustainability Analysis

Pilot Program Data Collection

Infrastructure Mapping

Behavioural Studies
